1st strand cDNA was primed with a NotI-oligo(dT) primer. Five prime
end enriched, double-strand cDNA was digested with Not I and cloned
into the Not I and EcoXV sites of the pCMVSPORT 6 vector. Library
was not normalized. Library was constructed by Life Technologies, a

1st strand cDNA was primed with a NotI-oligo(dT) primer. Five prime
end enriched, double-strand cDNA was digested with Not I and cloned
into the Not I and EcoRV sites of the pCMVSPORT 6 vector. Library
was not normalized Library was constructed by Life Technologies, a
division of Invitrogen.

// CLONE ILD="SLISNUSIGN"
// CLONE ILD="SLISNUSIGN"
// Site 2: Not1; The poly (A) + RNA was dephosphorylated with
bacterial alkaline phosphatase (BAP) and then decapped
with tabacco acid pyrophosphatase (TAP). The decapped
intext mRNA was ligated with DNA-RNA linker including ECOR
I site by treatment of T4 RNA ligase and the first strand
cDNA was synthesized from oligo dT-selected mRNA by
priming with dT-tailed vector. The CDNA vector was
adjusted to have about 60nt. The cDNA vector was
circularized with E. coll DNA ligase after digestion of
ECORI which site is also included in vector. An RNA strand
converted to a DNA strand by Okayama-Berg method. The
converted colls E. coll TOPAlly this method are
the cDNA libraries constructed by this method are
full-length enriched cDNA library."

/uncte="Vector: pCMV-Sport6; Site 1: Not1; Site 2: Sal1; /note="Vector: pCMV-Sport6; Site 1: Not1; Site 2: Sal1; This is a long-transcript enriched CDMA library (Genome Res. 11: 1553-1558 (2001). [PMID: 11544199] From WA01 cell line . Undifferentiated human ES cell line WA01 was obtained from Wichall Research Institute, Inc., Madison, Wi, cultured according to their instructions on MEF feeders. They formed round colonies with defined edges and were positive for alkaline phosphatase, SERA-4, OCT3, OCT4, REX1, OTF, TERT, SOX2, CX43 and CX45. They are negative for GATA2, GRA4, PDX1, NCAM, MSX1, FLT3, SEBA-1, TUBB3, NES, GFAP, and EOMES. When confluent (18-10 days after plating), the ES cells from 4 X cm dishes were treated with 1 mg/ml collegenase, type IV (Invircogen/GIECO) for 5-10 min and gently scraped off with 5 ml pipette. RNA was purified with TRIZOl Reagent from Invitrogen. Protocol ref. Genome Res. 11: 1553-1558 (2001). [PMID:11544199]) Double-stranded CDNAs were synthesized with an Oligo(dT) primer [Invitrogen: Strands with an oligo(dT) primer [Invitrogen: Column Then, the CDNAs were amplified by lethanol-precipitation. The CDNAs were amplified by long-range high fidelity PCR using Ex Tag polymerase (Takara) with a primer Sal4-s for 25 cycles. The products were purified by phenol/chloroform extraction and column. The CDNAs were amplified by mare purified by phenol/chloroform extraction and separated from extraction and centricon-100 column. The cDNAs were digested with Sal and Not! enzymes and cloned into Sal1/Not1 site of about 3.6kb."

```
polypeptides are hydroxylated by HAAH enzymes. HAAH is used in the method of the invention. The specification describes a method for diagnosing a malignant neoplasm in a mammal. The method comprises contacting a body fluid with an antibody which binds to HAAH polypeptide under complex forming conditions, and detecting the antigen-antibody complex. The method is useful for diagnosing and prognosing a malignant neoplasm in a bodily fluid e.g. central nervous system (CNS) derived body fluid, blood, serum, urine, saliva, sputum, lung effusion, and ascites fluid of mammal, where the neoplasm is derived from endodermal tissue and is selected from colon cancer, breast cancer, pancreatic cancer, liver cancer, cancer of bile ducts, and cancer cancer in the deal of the colon cancer for the CNS. HAAH antibodies, linked to a cytotoxic agent, are useful for killing tumour cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         720

The invention relates to diagnosing a neoplasm and inhibiting tumour growth in a mammal, using an antibody that binds to human aspartyl carparaginyl) beta-hydroxylase (HAAH). Diagnosing a neoplasm comprises in level of antibody binding at tissue site compared to the level of an increase in level of antibody binding at tissue site compared to the level of a monoplasm at the tissue site. Inhibiting tumour growth in mammal involves deministering the antibody conjugated to a cytcoxic agent to a mammal. Involves administering the antibody conjugated to a cytcoxic agent to a mammal. In a mammal involves and included are a method of conferring an immune response to a tumour cell in a mammal party administering to the mammal and propertied (or a polymuclectied composition encoding the antibody or an HAAH polypeptide, or its degenerate variant), a fragment of HAAH, and the polypeptide (or a polymuclectied composition encoding the polypeptide, or its degenerate variant), a fragment of HAAH, and the polypeptide, or its degenerate variant, and expensive the antibody is FBSO, and a fragment of HAAH (where the antibody is FBSO, 66A, 5C7 or 19B) a hybridoma cell line chosen from hybridoma PBBO, HA386A, HA1SCA and HA219B, and a fragment of HAAH which lacks enzymatic activity or alpha-ketoglutarate binding domain and each astrocytoma cell and HAAH-specific immune cesponse to a brain tumour growth in a mammal, conferring an immune cervicatic carcinoma cell and for inducing a HAAH-specific immune response to a mammal, for conferring immune response to a paracteric carcinoma cell and for inducing a HAAH-specific immune response in a mammal. How cancer, pancreatic carcinoma cell and for inducing a HAAH-specific immune ceponse in a mammal that or conferring immune response to a carcinoma cell and for inducing encert and cancer, pancreatic carcinoma cell and for inducing encert and cancer, pancreatic carcinoma cell and for inducing encert and cancer, pancreatic carcinoma manal conferring a useful for diagnosing nephame cell origin an
          human aspartyl
nammal with detectably-labeled antibody which binds to (asparaginyl) beta-hydroxylase.
                                                                                        Example 1; Page 4-5; 34pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Dp
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ò
                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a method for inhibiting tumour growth in a mammal. The method comprises administering to the mammal a compound, which inhibits the expression or enzymatic activity of a human aspartyl (asparaginyl) beta-hydroxylase (HAAH). The compound may inhibit HAAH hydroxylation of a NOTCH polypeptide. In particular, the compound may inhibit hydroxylation of an epidermal growth factor (EGF)-like repeat sequence in a NOTCH polypeptide. The methods are useful for inhibiting tumour growth or killing tumour cells, or for diagnosing or prognosticating a mallignant neoplasm. In particular, the tumour or neoplasm is colon cancer, breast cancer, pancreatic cancer, liver cancer, grace of the bile ducts, or cancer or tumour of the central nervous system (CNS). The present sequence encodes HAAH.
                                                                                                                                                                                                                                                                            Inhibiting tumor growth or killing tumor cells (e.g. cancer of the colon, breast, pancreatic, liver or the central nervous system), by administering an inhibitor of the human aspartyl (asparaginyl) betahydroxylase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  180

The invention relates to a novel isolated nucleic acid and the PRO polypeptide encoded by it. A protein of the invention has polypeptide encoded by it. A protein of the invention has polypeptide encoded by it. A protein of the invention has antiarthritic, antialatergic, and propertied is useful for treating an immune related disorder such as systemic lupus erthritis, a spondyloarthropathy, systemic solerosis, antidopathic inflammatory myopathy. Slogren's syndrome, systemic clupus erthritis, a sarcoidosis, autoimmune haemolytic anaemia, autoimmune disease, a demyelinating disease mellitus, immune-mediated renal disease, a demyelinating polymeuropathy, antialateral nervous construction inflammatory demyelinating polymeuropathy, a hepatobilary disease, infectious or autoimmune chronic active hepatitis, primary cirrhosis, granulomacous hepatitis, sclerosing chood inflammatory demyelinating polymeuropathy, whipple's bilary cirrhosis, granulomacous hepatitis, sclerosing chood infecase, arthoma multiforme, contact dermatitis, psoriasis, an altergic chimitis, acopic dermatitis, gooriasis, an allergic chimitis, acopic dermatitis, grantly hypersensitivity, urticaria, an immunologic disease of the lung, hypersensitivity, urticaria, an immunologic disease of the lung, hypersensitivity, articaria, an immunologic disease, grade menteropathy content demonitis, a transplantation associated diseases, grade menteropathy content demonit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New PRO polypeptides and polymucleotides, useful for treating e.g. erythematosus, rheumatoid arthritis, diabetes mellitus, immune-mediated renal disease, or demyelinating diseases of the central or peripheral nervous system.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AGCATGGAGGACACAAGAATGGGAGGAAAAGGCGGACTCTCGGGAACTTCATTCTTCACGT

Specifically, it refers to a method for the identification of target genes whose expression is correlated with an early stage in the regulation of apoptosis. The present invention describes a method of contacting either candidate agents or control agents to the target genes contacting either candidate agents or control agents to the target genes candidate agent is selected from a low molecular weight organic molecule, an antibody or fragment thereof, an antisense oligonucleotide, methods are useful for diagnosing and treating diseases or conditions associated with abnormal apoptosis in mammalian tissue, such as cancer, inflammation, autoimmune or neurodepencrative disorders. Accordingly, they exhibit cytostatic, antiinflammatory, immunosuppressive and neuroprotective activities. These may also be used for drug screening curposes and in gene therapy. This polynucleotide sequence is a human personal and a propriet in the regulation of apoptosis that can be added to the conditions are associated with the regulation of apoptosis that can be

This invention relates to novel isolated cDNAs that are differentially expressed in MYCN activated cells. Specifically, it refers to compressed in MYCN activated cells. Specifically, it refers to protected sequences that exhibit differential expression patterns in cells activated by the transactivator MYCN, where MYCN is a protectly and anoters. The present invention describes these componing sneeds. The present invention describes these componing to a useful for in hybridisation assays to detect expression of nucleic acids for complementary nucleic acids) in a present in a given sample, as specifically bind the cDNA as a ligand and modulate function or activity. Accordingly, these compositions exhibit cytostatic activity and can also that is differentially expressed in MYCN activated cells, given in an exemplification but has been obtained in electronic format from the US petent Office at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New genes regulated by MYCN activation, useful in gene therapy, particularly for treating a subject with e.g. neuroblastoma or other cancers, or for diagnosing, staging or monitoring the treatment of the

The invention relates to new isolated nucleic acid molecule comprising a nucleic acid molecule consisting of a gene differentially expressed in cells undergoing differentiation from mesenchymal cell to a cells undergoing differentiation from mesenchymal cell to a chondroblastic phenotype, or hybridising under stringent conditions to them (or their fragments). Also included are expression vectors, transformed host cells, expressed polypeptides or peptide fragments of minimogen). binding partners of the polypeptides or peptide fragments of identifying an agent useful in modulating mesenchymal cell and may be used as an immogen). binding partners of the polypeptides, a method for differentiation induction activity of a molecule, a method of diagnosing a condition characterized by aberrant expression of a nucleic acid molecule or its expression product, a method for determining regression, progression or onset of cartilaginous tissue degeneration condition, a method for treating a subject to reduce the cisk of cartilaginous tissue degeneration condition, and a solid-phase nucleic condition, and acid molecule array consisting essentially of a set of nucleic acid molecule array consisting essentially of a set of nucleic acid differentially expressed in developing mesenchymal cells using the celliferentially expressed in developing mesenchymal cells using the conditions and agents and agents and agents are useful for treating cartilaginous tissue of degeneration conditions and agent arthritis, rheumatoid arthritis, deptherm and solvant arthritis, arthritis deformans, infectious conditions and agent arthritis, arthritis deformans, infectious and agent arthritis, arthritis deformans, infectious and submarchymal cells are submarchymal cells arthritis arthritis, actually expressed in developing mesenchymal cells arthritis actually expressed in developing mesenchymal cells arthritis, adjuvant arthritis arthritis deforment in developing mesenchymal cells arthritis arthritis arthritis arthritis arthritis arthritis arthritis 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New nucleic acid molecules capable of promoting chondrogenesis, useful for diagnosing and treating cartilaginous tissue degeneration conditions, e.g. offeoarthritis, rheumatoid arthritis, gout arthritis, or
                                                                                                                                                                                                                                                                                                       Human, 88; gene; skeletal growth; cartilage degeneration disorder; chondroblastic phenotype; mesenchymal cell; cartilage formation; bone formation; arthritis; osteoarthritis; rheumatoid arthritis; gout arthritis; adjuvant arthritis; arthritis; arthritis; arthritis; osteochondrosis; RDA; antiarthritic; osteopathic; antirheumatic; antiinflammatory; representational difference analysis.
